

Play Game Case – Step Summary

Main problem: Find the largest value for every suit in an incomplete deck of cards.

Step 1 – Understand the Problem:

Identify the input, output, card information, possible suits, values, and restrictions before writing code.

Step 2 – Represent the Data:

Create a Suit enum and a Card class to represent each card's suit and value.

Step 3 – Create the Deck:

Use a Card array to store multiple cards in the incomplete deck.

Step 4 – Generate the Deck:

Use Random and a loop to create cards with random suits and values from 1 to 13.

Step 5 – Test the Deck:

Print all generated cards to verify that the deck and random values are working correctly.

Step 6 – Solve a Smaller Problem:

First find the largest value in the whole deck before considering the different suits.

Step 7 – Solve for Every Suit:

Repeat the maximum-value search for Diamonds, Hearts, Spades, and Clubs separately.

Step 8 – Use a Guard:

Skip cards that do not belong to the suit currently being checked.

Step 9 – Clean Up:

Remove temporary testing and printing code once the main solution works.
